1.0 Introduction

1.1 Mashup Description

Easy Money is an API mashup web application which helps a user research trending stocks quickly. The application combines financial market data with news and charting APIs to deliver the user experience beyond simply viewing prices. The mashup can find trending stocks and deliver it alongside relevant news, but also the reverse where news is parsed for company mentions. This allows research on trending companies to be done quickly as trending stocks, associated news, and charting are combined into an easy to use interface. The focus is on US share markets with some support for other major exchanges.

There are three use cases of the web page. First, trending stock lists (range of market factors available) can be found along with news explaining why. Second, headline news can be parsed for company mentions and their recent financial performance provided. Last, charting of a stock is available for visualising historic data if a company is worth viewing further. Figure 1 shows the web interface shown on initial load and further interactions are shown later.

The screenshot shows the 'Easy Money API Mashup' web application. It features three main sections: 'Market Trends', 'Parse News', and 'Chart Stock'. Each section has a description, a selection prompt, and several dropdown menus or input fields. Below these sections are three blue buttons: 'Get trending stocks >', 'Get trending news >', and 'Get stock chart >'. At the bottom, there is a 'Results' section with the text 'Your results will display here' and a small text 'Andrew Mather, n9713671, 2020'.

Figure 1 – Web application on initial load

1.2 API Services

Five online REST APIs are used in the application. Each is listed below with a link with a short description of services and the endpoints used.

Alpha Advantage

<https://www.alphavantage.co/>

Alpha Advantage provides four categories of financial data APIs. These are stock time series, fundamental data, physical and crypto currencies, and technical indicators. The API takes HTTPS REST requests and returns JSON responses. The application will use stock time series and fundamental data endpoints.

Endpoint – stock time series, time_series_adjusted

This endpoint returns time series (date, open, high, low, close, volume, adjusted close, and split/dividend events) of the global equity specified, covering 20+ years of historical data. Data intervals available are daily, weekly, and monthly.

Endpoint:

https://www.alphavantage.co/query?function=TIME_SERIES_{interval}_ADJUSTED

Docs: <https://www.alphavantage.co/documentation/>

Endpoint – fundamental data, company_overview

This API returns company information, a description, financial ratios, and other key metrics for the equity specified. Data is generally refreshed on the same day a company reports its latest earnings and financials.

<https://www.alphavantage.co/query?function=OVERVIEW>

Docs: <https://www.alphavantage.co/documentation/>

IEX Cloud

<https://iexcloud.io/>

IEX Cloud is a financial data platform which provides similar services to Alpha Advantage above. This API is included as it provides a specific endpoint required that Alpha Advantage does not. The API takes HTTPS REST requests and returns JSON responses. The application uses trending stock lists endpoint.

Endpoint – Market Info, List

Returns an array of quotes for the top 10 symbols in a specified list. A list limit less than 10 can be provided and several list types (collections) are available. These are top gains, top losses, most active, and the highest volume.

Endpoint: <https://cloud.iexapis.com/stock/market/list/{list-type}>

Docs: <https://iexcloud.io/docs/api/#list>

News API

<https://newsapi.org/>

News API is a HTTP REST API to search and retrieve articles from global news sources across the web. Two main endpoints provide searchable data, top headlines, and everything. The API takes HTTP REST requests and returns JSON responses. The application will use both endpoints to search for specific news or parse headlines.

Endpoint – Everything

Search through millions of articles from over 50,000 large and small news sources and blogs. This includes breaking news as well as lesser articles.

Endpoint: <https://newsapi.org/v2/everything>

Docs: <https://newsapi.org/docs/endpoints/everything>

Endpoint – Top headlines

This endpoint provides live top and breaking headlines for a country, specific category in a country, single source, or multiple sources.

Endpoint: <https://newsapi.org/v2/top-headlines>

Docs: <https://newsapi.org/docs/endpoints/top-headlines>

QuickChart

<https://quickchart.io>

QuickChart is an API for generating chart images, PDFs, or QR codes. QuickChart is open source and does not require an API key. The API takes HTTP REST requests and returns image file responses. The application uses the charting functionality to graph historic data.

Endpoint – Chart post

QuickChart works by taking Chart.js configurations and rendering them on the backend as an image. If your chart is large or complicated, you may prefer to send a POST request rather than a GET request. This avoids limitations on URL length.

Endpoint: <https://quickchart.io/chart>

Docs: <https://quickchart.io/documentation/#post-endpoint>

Yahoo Finance

Link: <http://d.yimg.com/autoc.finance.yahoo.com>

This API allows access to several Yahoo Finance services by providing a function callback in the query. The API does not require a key and returns a mixed string and JSON responses. The application uses this to convert parsed company names into stock symbols. This endpoint is deprecated, and no docs are available, however, it is still functional. Parameters required are company name, region, language (lang), and the callback function. The relevant callback function is `YAHOO.Finance.SymbolSuggest.ssCallback`.

1.3 Statement on Assignment Demo

I intend to demonstrate my application face-to-face.

2.0 Mashup Use Cases and Services

2.1 Market Trends Use Case

As an	Investor
I want	To discover trending stocks and research why quickly
So that	I can narrow searches for large changes and companies of interest

This use case allows a user to quickly find trending stock information on a selected market factor. The user can select the trend of interest and some data limits. The user controls provided for this are shown in Figure 2. The collection choices provided are top gains, losses, volume, and most active. This case mashes API results from IEX Cloud with the News API. First, the user-chosen collection is used in a request to IEX Cloud. The results are presented in a table of stock results shown in Figure 3. Now users can request news for these trending stocks (by market factor) which is returned in a new table shown in Figure 4. The table adds new rows until cleared, or new stock request submitted. The two stages were separated to reduce clutter from all news appearing at once and allow the user more control.

Market Trends

2.2 Parse News Use Case

As an	Investor
I want	To discover companies trending in the news
So that	I can quickly see financial their performance and potential as a stock

This use case allows a user to parse headline news to find trending company mentions and related stock financial information. The user can select a country and category of interest and the application handles the rest until display. The user controls provided for this are shown in Figure 5. Nine major countries are available to choose, and six news categories. The best results are obtained on US business news. This case mashes API results from the News API with Yahoo Finance and then Alpha Advantage. First, the user choices are provided in the News API request to retrieve the relevant top headlines. The server parses this for likely company names and these are converted to stock symbols with the Yahoo Finance API. The company symbols are then used in requests to Alpha Advantage for company overview and key fundamental data when a user selects the stock in the list. Application results are presented in a table listing stocks against each article shown in Figure 6. Tables contain hyperlinks to the news source but also links on company symbols to open a modal of stock information, shown in Figure 7.

Tesla, Inc (TSLA)

Tesla, Inc. designs, develops, manufactures, leases, and sells electric vehicles, and energy generation and storage systems in the United States, China, Netherlands, Norway, and internationally. The company operates in two segments, Automotive; and Energy Generation and Storage. The Automotive segment offers sedans and sport utility vehicles. It also provides electric powertrain components and systems; and services for electric vehicles through its company-owned service locations, and Tesla mobile service technicians, as well as sells used vehicles. This segment markets and sells its products through a network of company-owned stores and galleries, as well as through its own Website. The Energy Generation and Storage segment offers energy storage products, such as rechargeable lithium-ion battery systems for use in homes, industrial, commercial facilities, and utility grids; and designs, manufactures, installs, maintains, leases, and sells solar energy generation and energy storage products to residential and commercial customers. It also provides vehicle insurance services, as well as renewable energy. The company was formerly known as Tesla Motors, Inc. and changed its name to Tesla, Inc. in February 2017. Tesla, Inc. was founded in 2003 and is headquartered in Palo Alto, California.

2.3 Stock Charting Use Case

As an	Investor
I want	To check on the historic performance of stock factors
So that	Get additional information for decisions while viewing the trend and news information of the previous use cases.

This use case allows a user to stock historic chart information quickly after seeing companies of interest from the previous use cases. The user can select a stock symbol, a data interval (frequency) and the type of data desired. Data types are price close, open, high, low, and volume. The user control view can be seen in Figure 8. This case mashes API results from Alpha Advantage with QuickChart. First user choices are used in the Alpha Advantage API request to retrieve historic stock data. The server constructs the chart data from this which can be quite long. Thus secondly, a post request to QuickChart's API is sent and the chart image retrieved, saved in the server's public files and displayed to the user. An example output can be seen in Figure 9. Note the stock symbol link opens the additional detail modal (using an Alpha Advantage API request) discussed in the previous use case.

3.0 Technical breakdown

3.1 Architecture and Data Flow

This is a web application with responsibilities split between server and client-side. The Node.js server handles all requests and responses to APIs and performs any data manipulation required. The client-side handles user input, sends requests to the server, and displays returned data. The server is accessed via port 3000 on localhost, and the docker container mapped to port 80 when deployed. The main server technologies are Node.js (12.18.3), routing with Express (4.16.4), and requests with Axios (0.20.0). The main client-side technologies are Bootstrap (4.5.2) for display and styling and Knockout (3.5.1) for a view model and data bindings.

Source code layout

The application source code is organised in a standard layout as shown in the left-most list in Figure 11. The client-side contained within the “public” folder is shown in the middle list, and the “routes” contents are shown in the right-most list.

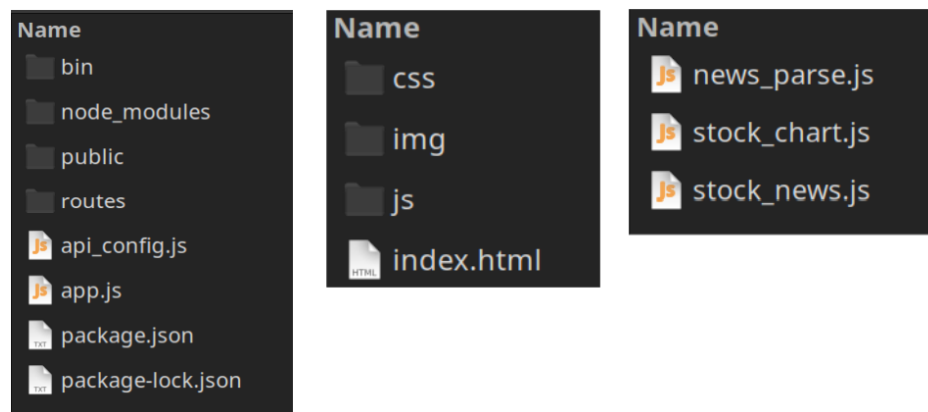

Figure 10 - Source code layout

There are several files at the root of the application. The file “app.js” sets up the Express application, and the three server routers used, previously listed. The “api_config.js” file contains API links and keys the routers consult to send correct API requests. The package and package-lock JSON files contain project dependencies and set “npm start” to run “node ./bin/www” to start the server. The “bin” folder contains the “www” file which starts a HTTP server on port 3000 and handles server connections. While the “node modules” folder contains installed NPM packages.

The “public” folder contains the client-side source code, with the single page index HTML file and supporting assets. The “css” folder contains Bootstrap CSS and a custom stylesheet. The “img” folder contains the application favicon and a chart image when generated. The “js” folder contains JavaScripts for Bootstrap, JQuery, Knockout, and a custom script file which implements the web page view model.

The “routes” folder contains the express application routers which handle most of the server processing and client requests. These are set up in “app.js” and will be further discussed in the server-side discussion below.

Server-side

The server initially sets up four application routes, the index at “/” and three routers are set up at the routes shown below. The flowchart in Figure 10 describes the server process when a user request is made and links it to the use cases and their API calls discussed in the previous section.

```
// Setup application routes
app.use("/api/stock", apiMarketTrends);
app.use("/api/parse", apiNewsParse);
app.use("/api/chart", apiStockChart);
```

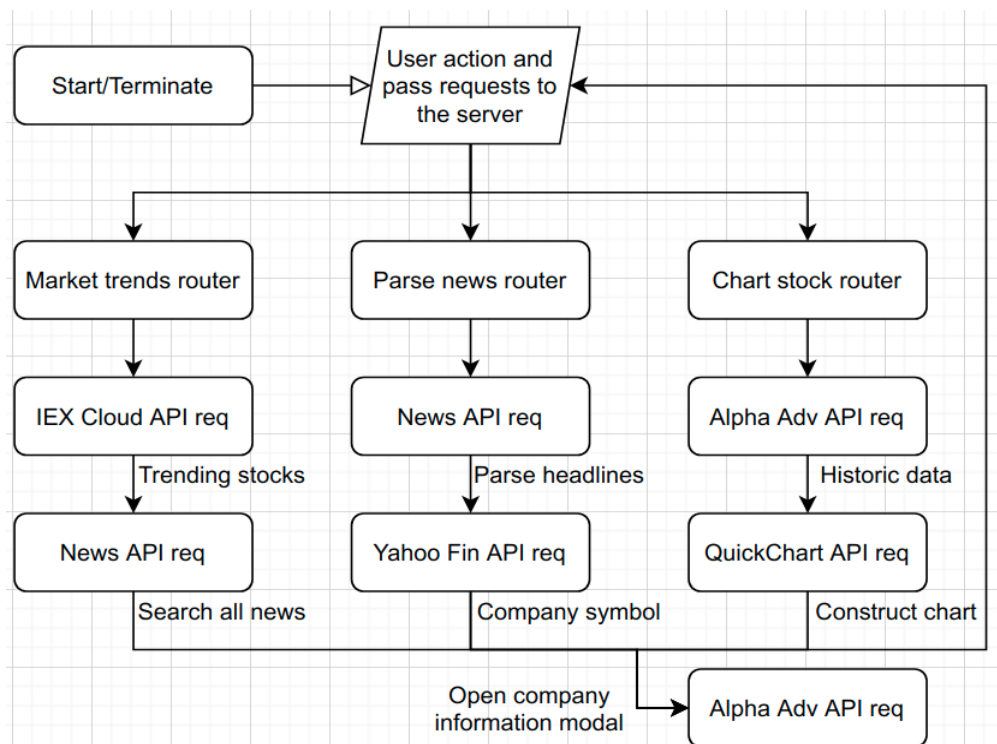

Figure 11 – Server-side flowchart

A partial code example of the market trends router handling a client request to search for news about a stock is provided in Figure 12. This shows the route called with user parameters. The News API request URL is constructed, then called using Axios, and further data processing takes place afterwards before returning JSON data to the client.

```
// Route for use case finding trending stocks and associated news, news component
router.get("/news/:search/:articlelimit", (req, res) => {
  // Handle parameters and construct url for desired news search
  const search = req.params.search;
  const url = `${api.newsApi.hostname}${api.newsApi.path_search}?q=${search}&apiKey=${api.newsApi.key}`;

  // Call News API for searched news
  axios.get(url).then(response => {
    // Receive data and take desired properties
    const data = response.data;
  });
});
```

Figure 12 – Example server handling a client request

Client-side

The client-side is designed as a single page application and built with the package Knockout. Knockout allows declarative bindings to DOM elements, automatic UI refresh, dependency tracking, and templating. A class is constructed (in JavaScript) which can contain Knockout observable variables such as those below. Any update to these observable variables will automatically update on the UI.

```
self.showParsed = ko.observable(false);
self.parsedList = ko.observableArray([]);
```

These observables, along with functions and standard JavaScript are contained within a class called a view model. Knockout can bind this view model to a HTML page that has included the JavaScript file.

```
// Create view model and apply bindings
$(function() {
    "use strict";
    ko.applyBindings(new ViewModel());
});
```

This HTML page now has access to the variables and functions within the view model. An example of the parse news results implementation is shown below. The first highlighted text shows where Knockout can implement conditionals on whether to display one or many elements. The second highlighted text shows how variables can be looped to easily generate dynamic tables or other features. Within this table, elements can have their click actions bound to functions or contents bound to properties of the observable array elements.

```
<!-- Parse news use case results -->
<!-- ko if: showParsed -->

```

3.2 Deployment and the Use of Docker

Docker was used to generate a container image and store it on Dockerhub. This allows easy retrieval by cloud instances to run the application. The image was generated using a Dockerfile shown in Appendix A. Key aspects are build the image on Ubuntu 18.04, install NodeJS 12.x, add source code, install NPM packages, and use the Dockerfile "CMD npm start" to start the server when the image is run.

3.3 Test plan

Table 1 displays the test plan for the application to validate functionality. All tests pass and evidence denotes the screenshot number in Appendix B to refer to.

Table 1: Test plan

Task	Expected	Result	Evidence
Request market trends with gains, stock limit 1, and article limit 1.	A table should display with one row displaying the stock symbol, company, exchange, price, change, volume, date, and a news button.	Pass	01
Open company information modal by clicking the company name hyperlink in the table from the prev test.	A popup modal should appear as the foreground, and the main content becomes the background. The modal should contain company description and stats, or display not found if such occurs.	Pass	02
Request get news for the displayed stock from the first test.	A second table should display with one-row displaying company, article photo, article title and description, source, and the date.	Pass	03
Select clear news after prev test.	The trending news table should be removed by the UI.	Pass	04
Repeat the prev four tests with active, stock limit 3, and article limit 3.	Results should be as before but with the corresponding number of table rows as the user option selections.	Pass	05
Request parse news with country US and category business.	After some time, a table should display with several rows of articles and stock symbols.	Pass	06
Open company information modal by clicking the company stock hyperlink in the table from the prev test.	A popup modal should appear as the foreground, and the main content becomes the background. The modal should contain company description and stats, or display not found if such occurs.	Pass	07
Also, click the article hyperlink	A new tab should open with the sourced article	Pass	nil

Request chart stock with symbol GOOG, monthly, and close data.	The chart should appear with Google historic close price history at monthly intervals.	Pass	08
Open company information modal by clicking the company stock hyperlink in the table from the prev test.	A popup modal should appear as the foreground, and the main content becomes the background. The modal should contain company description and stats, or display not found if such occurs.	Pass	09
Provide an invalid symbol format that is not only letters.	Results should display "Error occurred, please check your inputs".	Pass	10
Provide a non-existent symbol that is still valid entry.	Results should display "Error occurred, please check your inputs".	Pass	11
Run client after network loss	All requests should display an appropriate error.	Pass	12
Decrease browser width to the minimum allowed.	UI should handle the changing size and rearrange itself appropriately.	Pass	13

3.4 Difficulties and Issues

No notable difficulties were encountered during the application's development. All planned functionality has been completed and no known bugs exist.

4.0 User guide

On launch, a user is presented with the following Figure 13 screen with three distinct areas for the three use cases. This guide will cover these from left to right.

Nano-X Imaging Ltd. (NNOX)

Nano-X Imaging Ltd. engages in developing and producing X-ray source technology for the medical imaging industry in the United States. It develops novel digital X-ray source, a microelectromechanical system-based semiconductor cathode that achieves electron emission by a non-thermionic low-voltage trigger to nano-scale molybdenum cones. The company also develops a prototype of the Nanox.ARC, a medical imaging system incorporating its novel digital X-ray source; and Nanox.CLOUD, a companion cloud software designed to deliver medical screening as a service. Nano-X Imaging Ltd. was incorporated in 2018 and is based in Neve Ilan, Israel.

Tesla, Inc (TSLA)

Tesla, Inc. designs, develops, manufactures, leases, and sells electric vehicles, and energy generation and storage systems in the United States, China, Netherlands, Norway, and internationally. The company operates in two segments, Automotive; and Energy Generation and Storage. The Automotive segment offers sedans and sport utility vehicles. It also provides electric powertrain components and systems; and services for electric vehicles through its company-owned service locations, and Tesla mobile service technicians, as well as sells used vehicles. This segment markets and sells its products through a network of company-owned stores and galleries, as well as through its own Website. The Energy Generation and Storage segment offers energy storage products, such as rechargeable lithium-ion battery systems for use in homes, industrial, commercial facilities, and utility grids; and designs, manufactures, installs, maintains, leases, and sells solar energy generation and energy storage products to residential and commercial customers. It also provides vehicle insurance services, as well as renewable energy. The company was formerly known as Tesla Motors, Inc. and changed its name to Tesla, Inc. in February 2017. Tesla, Inc. was founded in 2003 and is headquartered in Palo Alto, California.
